

61) Minimum Time to Collect All Apples in a Tree

Given an undirected tree consisting of n vertices numbered from 0 to $n-1$, which has some apples in their vertices. You spend 1 second to walk over one edge of the tree. Return the minimum time in seconds you have to spend to collect all apples in the tree, starting at vertex 0 and coming back to this vertex.

The edges of the undirected tree are given in the array `edges`, where `edges[i] = [ai, bi]` means that exists an edge connecting the vertices `ai` and `bi`. Additionally, there is a boolean array `hasApple`, where `hasApple[i] = true` means that vertex `i` has an apple; otherwise, it does not have any apple.

Example 1:

Input: $n = 7$, `edges = [[0,1],[0,2],[1,4],[1,5],[2,3],[2,6]]`, `hasApple = [false,false,true,false,true,true,false]`

Output: 8

Explanation: The figure above represents the given tree where red vertices have an apple. One optimal path to collect all apples is shown by the green arrows.

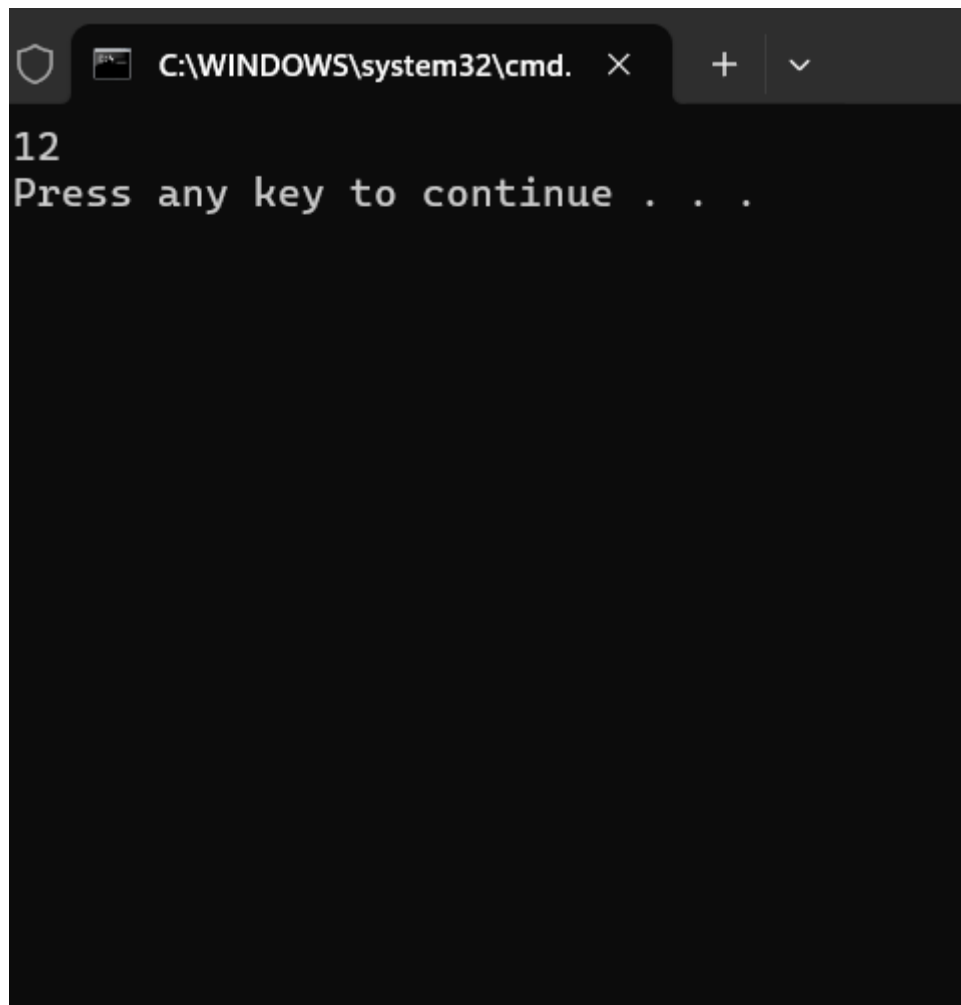

CODE:

```
def minTimeToCollectApples(n, edges, hasApple):
    graph = [[] for _ in range(n)]
    for u, v in edges:
        graph[u].append(v)
        graph[v].append(u)

    def dfs(node, parent):
        time = 0
        for neighbor in graph[node]:
            if neighbor != parent:
                time += dfs(neighbor, node)
        if (time > 0 or hasApple[node]) and node != 0:
            return time + 2
        return time

    return max(0, 2 * (dfs(0, -1) - 2))

# Example usage
n = 7
edges = [[0,1],[0,2],[1,4],[1,5],[2,3],[2,6]]
hasApple = [False,False,True,False,True,True,False]
print(minTimeToCollectApples(n, edges, hasApple))
OUTPUT:
```

```
12
Press any key to continue . . .
```

TIME COMPLEXITY : $O(n)$
