17. Given two integer arrays nums1 and nums2, return an array of their intersection. Each element in the result must appear as many times as it shows in both arrays and you may return the result in any order.

AIM: Find two integer arrays nums1 and nums2, return an array of their intersection. Each element in the result must appear as many times as it shows in both arrays and you may return the result in any order.

CODE:

```
def intersection(nums1, nums2):  
    count1 = {}  
    for num in nums1:  
        count1[num] = count1.get(num, 0) + 1  
    intersection = []  
    for num in nums2:  
        if num in count1 and count1[num] > 0:  
            intersection.append(num)  
            count1[num] -= 1  
    return intersection  
  
nums1 = [1, 2, 2, 1]  
nums2 = [2, 2]  
print(intersection(nums1, nums2))
```

OUTPUT:

```
[2, 2]  
=== Code Execution Successful ===
```

TIME complexity:

$O(n \log n + m \log m)$
